Introduction

- Standard WHO multi-drug treatment (MDT) for leprosy consists of medications that are potentially harmful and cause a range of adverse systemic effects
- Paucibacillary leprosy, characterized by limited skin lesions and a low bacillary load, may be most amenable to a fluoroquinolone-based treatment protocol
- Monthly- or single dosing of ROM has emerged as a potential treatment option for leprosy, however, a synthesis of the evidence supporting ROM does not exist

Methods

- Abstracts reporting the efficacy & safety of monthly ROM treatment in paucibacillary leprosy in human patients were targeted using combinations of search terms related to "leprosy" (including "Hansen's disease" and "M. leprae") and "rifampin," "ofloxacin," "minocycline," and "ROM," along with their common synonyms and trade names (from inception to June 2025)
- Inclusion Criteria: Systematic reviews, randomized controlled trials, clinical trials, cohort studies, observational studies, case-control studies, case series (N>5), English and non-English publications
- Exclusion Criteria: Case reports, case series (N<4)

Table 2. Preliminary Summary of Primary Outcomes; *Not included in mean/median/range

- •Interim findings suggest that patient lesion clearance and treatment failure is greater in the comparator group (+4.69% and +2% respectively)
 - Relapse, side effects, and reversal reactions are greater in the ROM group (+0.39%, +0.42%, and +8.15% respectively). This suggests that ROM is slightly less efficacious than its comparator, however a more robust analysis is necessary.
- •Qualitatively, several determinants of health were identified throughout this analysis including:
- •Social environments 50% of non-adherent patients denied having leprosy due to potential loss of jobs and/or marriage prospects²⁵
- Patient education 86% of respondents did not understand the concept of their disease 12
- Gender Women completed treatment at a rate of 65.6% and men at 79.2% (p<0.05) 26
- Further investigation to better understand gender- and sex-based influences on treatment and prognosis warranted

 Synthesizing the current evidence discussing the efficacy of monthly ROM, will strengthen the current body of knowledge surrounding the treatment of paucibacillary leprosy, and may allow for the development of standardized fluoroquinolone-based treatment protocols.

Figure 1. PRISMA Flowchart

^{*}Low-dose Convit vaccine contained 1.6x10⁷ heat-killed *M. leprae* in 0.1ml saline and 1.5x10⁷BCG in 0.1ml saline
